3-AZETIDINYALKYLPIPERIDINES OR -PYRROLIDINES AS TACHYKININ ANTAGONISTS

This invention relates to therapeutic agents, specifically azetidinyalkyl derivatives of N-substituted nitrogen heterocycles, and to processes for the preparation of, intermediates used in the preparation of, compositions containing and uses of, such heterocycles.

International Patent Publication Number WO 96/05193 discloses various (azetidin-1-ylalkyl) lactams as tachykinin antagonists.

The present heterocycles are antagonists of tachykinins, including neurokinin A (NKA), neurokinin B (NKB), and Substance P, acting at the human neurokinin-1 (NK₁), neurokinin-2 (NK₂) or neurokinin-3 (NK₃) receptor, or a combination of two or more thereof. The heterocycles are therefore useful for preventing or treating an inflammatory disease such as arthritis, psoriasis, asthma or inflammatory bowel disease, a central nervous system (CNS) disorder such as anxiety, depression, dementia or psychosis, a gastro-intestinal (GI) disorder such as functional bowel disease, irritable bowel syndrome, gastro-oesophageal reflux, faecal incontinence, colitis or Crohn's disease, a disease caused by Helicobacter pylori or other urease positive gram negative bacteria, a urogenital tract disorder such as incontinence, hyperreflexia, impotence or cystitis, a pulmonary disorder such as chronic obstructive airways disease, an allergy such as eczema, contact dermatitis, atopic dermatitis, urticaria, eczematoid dermatitis or rhinitis, a hypersensitivity disorder such as poison ivy, a vasospastic disease such as angina or Reynaud's disease, a proliferative disorder such as cancer or a disorder involving fibroblast proliferation, a fibrosing or collagen disease such as scleroderma or eosinophilic fasciitis, reflux sympathetic dystrophy such as shoulder/hand syndrome, an addiction disorder such as alcoholism, a stress-related somatic disorder, a peripheral neuropathy such as diabetic neuropathy, neuralgia, causalgia, painful neuropathy, a burn, herpetic neuralgia or post-herpetic neuralgia, a neuropathological disorder such as Alzheimer's disease or multiple sclerosis, a disorder related to immune enhancement or suppression such as systemic lupus erythematosus, a rheumatic disease such as fibrositis, emesis, cough, acute or chronic pain, migraine, an ophthalmic disease such as proliferative retinopathy, influenza or a cold.

REPLACED

The present derivatives are particularly potent and selective antagonists of tachykinins, including NKA, NKB and Substance P, acting at the human NK₁, NK₂ and NK₃ receptors or combinations of two or more thereof. They are particularly useful for treating or preventing an inflammatory disease such as arthritis, psoriasis, asthma or inflammatory bowel disease, a central nervous system (CNS) disorder such as anxiety, depression, dementia or psychosis, a gastro-intestinal (GI) disorder such as functional bowel disease, irritable bowel syndrome, gastro-oesophageal reflux, faecal incontinence, colitis or Crohn's disease, a urogenital tract disorder such as incontinence or cystitis, a pulmonary disorder such as chronic obstructive airways disease, an allergy such as eczema, contact dermatitis or rhinitis, a hypersensitivity disorder such as poison ivy, a peripheral neuropathy such as diabetic neuropathy, neuralgia, causalgia, painful neuropathy, a burn, herpetic neuralgia or post-herpetic neuralgia, cough or acute or chronic pain.

or any such compound with the stereochemistry shown above in formula (IA) at the position of attachment of the X and R¹ groups to the N-acylated or N-sulphonylated ring, or a pharmaceutically acceptable salt of any thereof.

The compounds of the formula (I) provided by the invention can be prepared by the following methods:-

- 1) The compounds of the formula (I) where X is (C₀-C₃ alkylene)CH₂-, the methylene group of which is attached to the azetidine nitrogen atom, and R, R¹, A, R², X¹ and m are as previously defined for a compound of the formula (I) can be prepared by reductive amination using as starting materials a compound of the formula:-

where R, A, R₁ and m are as previously defined for a compound of the formula (I), and a compound of the formula:-

, or an acid addition salt thereof, where R² and X¹ are as previously defined for a compound of the formula (I). The reaction is preferably carried out in the presence of a suitable acid, e.g. acetic acid.

The reaction proceeds via the initial formation of an intermediate iminium salt of the formula:

(IIIA)

which may be stable and isolatable. The reaction is preferably carried out without isolation of the intermediate of the formula (IIIA) in which case it is reduced in situ to provide a compound of formula (I).

In a typical procedure, an aldehyde of the formula (II) is first reacted with an azetidine of the formula (III) in a suitable solvent, e.g. tetrahydrofuran, and the mixture then treated with a suitable reducing agent, e.g. sodium triacetoxyborohydride or sodium cyanoborohydride, in the presence of a suitable acid, e.g. acetic acid, to give the required product. If an acid addition salt of an azetidine of the formula (III) is used as a starting material, a suitable acid acceptor, e.g. triethylamine, can be added prior to the addition of the reducing agent.

The reaction is typically carried out at room temperature.

The starting aldehydes of the formula (II) can be prepared by the method shown in the Scheme I:-

SCHEME I

SCHEME I (continued)

where R, A, R¹ and m are as previously defined for a compound of the formula (I) and Z and Z¹ are each a suitable leaving group, e.g. chloro, bromo, iodo, methanesulphonyloxy, p-toluenesulphonyloxy or trifluoromethylsulphonyloxy, and R-A-Z² is RCO₂H or a derivative thereof suitable for acylation of amines, or RSO₂Z² suitable for sulphonylation of amines.

Examples of Z² include chloro, bromo and iodo.

In a typical procedure, the acetonitrile derivative of the formula (IV) is first deprotonated using a suitable base, e.g. sodium hydride, and then alkylated in situ with an alkylating agent of the formula (V) where Z is preferably bromo. The reaction is typically carried out in a suitable solvent, e.g. tetrahydrofuran, at about 0°C for the deprotonation and at about room temperature for the alkylation. The reaction can also be carried out under phase transfer conditions using a suitable base, e.g. sodium hydroxide, a suitable phase transfer catalyst, e.g. tetra-n-butylammonium chloride, and a suitable solvent, e.g. cyclohexane, n-pentane or toluene.

The acetonitrile derivative of the formula (VI) that is produced is then first deprotonated using a suitable base, e.g. lithium diisopropylamide, and then alkylated in situ with a compound of the formula (VII) where Z¹ is preferably bromo. The reaction is typically carried out in a suitable solvent, e.g. tetrahydrofuran, at about -70°C, warming to about room temperature to complete the reaction. Tetra-n-butylammonium iodide can optionally be added following addition of the compound of the formula (VII) to increase the rate of reaction.

The compound of the formula (VIII) prepared is then reduced and cyclised to a lactam of the formula (IX) under suitable conditions, e.g. using Raney nickel under an atmosphere of hydrogen at atmospheric pressure and room temperature using ammoniacal ethanol as the solvent.

The lactam of formula (IX) is then reduced using a suitable reducing agent e.g. a metal hydride such as lithium aluminium hydride, under suitable conditions such as under an atmosphere of nitrogen, and in a suitable solvent such as tetrahydrofuran.

The cyclic amine (X) so produced is then reacted with RSO_2Z^2 , or an acid or acid derivative RCOZ^2 . In a typical procedure for $\text{A}=\text{CO}$, an acid chloride, RCOCl , is added to a mixture of a suitable base such as triethylamine, amine (X), and a suitable solvent such as dichloromethane. In a typical procedure for $\text{A}=\text{SO}_2$, a sulphonyl chloride, RSO_2Cl , is added to a mixture of a suitable base such as triethylamine, amine (X) and a suitable solvent such as dichloromethane.

The (sulphon)amide of the formula (XI) produced is then treated with a saturated solution of hydrogen chloride in a suitable $\text{C}_1\text{-C}_4$ alcohol, e.g. methanol, at about room temperature to remove the tetrahydropyran protecting group. The deprotection can also be carried out using a suitable ion exchange resin, e.g. Amberlyst 15 (trade mark), and in a suitable solvent, e.g. methanol.

The alcohol of the formula (XII) prepared is oxidised to an aldehyde of the formula (II) under suitable conditions, e.g. under Swern oxidation conditions (oxalyl chloride, dimethylsulphoxide, triethylamine, and using dichloromethane as the solvent).

An alternative method for the preparation of aldehyde of the formula (II) is illustrated in Scheme 2:-

SCHEME 2

where R, A, R¹ and m are as previously defined for a compound of the formula (I) and R-A-Z² is as previously defined in reference to Scheme I above.

The starting cyano-acids of the formula (XIII) may be prepared by conventional methods.

In a typical procedure, the nitrile group of the cyano-acid of formula (XIII) is reduced and cyclised using a suitable system, for example catalytic hydrogenation. The reaction is typically carried out in a suitable solvent, e.g. glacial acetic acid, at room temperature and at elevated pressures, and over a suitable catalyst, such as platinum oxide.

The so produced lactam (XIV) is then reduced to the cyclic amine (XV). In a typical procedure, a solution of lactam (XIV) is added to a suitable reducing system such as lithium aluminium hydride, in a suitable solvent such as tetrahydrofuran.

The so produced cyclic amine (XV) is then reacted with R-A-Z² where R-A-Z² is as defined above in relation to Scheme 1. In a typical procedure for A=CO, amine (XV) and acid RCO₂H are condensed to form amide (XVI; A=CO), using a coupling system such as N-methylmorpholine/1-hydroxybenzotriazole hydrate/1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride, in a suitable solvent, such as dichloromethane.

The (sulphon)amide (XVI) so produced is then treated with a suitable acid such as hydrochloric acid, in a suitable solvent e.g. tetrahydrofuran, at about room temperature, to remove the acetal protecting group. The deprotection can also be carried out using Amberlyst 15 (TM) in a suitable solvent such as acetone/water. Other suitable deprotections for acetals are to be found in "Protective Groups in Organic Synthesis" by TW Greene and PGM Wuts (2nd edn., Wiley Interscience).

Yet another alternative method for the preparation of aldehydes of the formula (II) where $m = 1$ is illustrated in Scheme 3:-

SCHEME 3

where R^1 , R^3 , Z, R, A and Z^2 are as previously defined.

In a typical procedure, a nitrile of formula (IV) is treated with a suitable base such as sodium hydride, then alkylated in situ with a compound of formula (XVII), where Z is as defined before. Compounds of formula (XVII) can be prepared by conventional methods. Z is preferably chloro, bromo, iodo or methanesulphonyloxy. The reaction is typically carried out in a suitable solvent such as N,N-dimethylformamide.

The so-prepared nitrile (XVIII) can then be deprotonated with a suitable base such as potassium *t*-butoxide, then reacted with a suitable acrylate ester, such as ethyl acrylate. The so-formed ester intermediate can then be hydrolysed to cyano-acid (XIX) using suitable hydrolysing systems such as 2N aqueous sodium hydroxide solution under suitable conditions such as stirring at room temperature.

The so-formed nitrile (XIX) can then be transformed by reduction using a suitable reducing agent, such as lithium aluminium hydride, in a suitable solvent such as tetrahydrofuran or by hydrogenation followed by reduction of the so-formed amide by borane.

The so-formed piperidine (XX) is then reacted in a similar manner as described for the transformations (X)→(XI) (Scheme 1) and (XV)→(XVI) (Scheme 2), above.

The amine derivative (XXI) so produced is then oxidised, such as, for example, by ozonolysis, in a suitable solvent such as methanol, followed by work up with a suitable reducing agent such as dimethyl sulphide, to give the aldehydes of formula II where m is 1.

The starting azetidines of the formula (III) may be prepared by conventional methods.

For oral and parenteral administration to human patients, the daily dosage level of the compounds of the formula (I) and their salts will be from 0.001 to 20, preferably from 0.01 to 20, more preferably from 0.1 to 10, and most preferably from 0.5 to 5, mg/kg (in single or divided doses). Thus tablets or capsules of the compounds will contain from 0.1 to 500, preferably from 50 to 200, mg of active compound for administration singly or two or more at a time, as appropriate. The physician in any event will determine the actual dosage which will be most suitable for an individual patient and it will vary with the age, weight and response of the particular patient. The above dosages are exemplary of the average case; there can, of course, be individual instances where higher or lower dosage ranges are merited, and such are within the scope of this invention.

Alternatively, the compounds of the formula (I) can be administered by inhalation or in the form of a suppository or pessary, or they may be applied topically in the form of a lotion, solution, cream, ointment or dusting powder. An alternative means of transdermal administration is by use of a skin patch. For example, they can be incorporated into a cream consisting of an aqueous emulsion of polyethylene glycols or liquid paraffin; or they can be incorporated, at a concentration between 1 and 10%, into an ointment consisting of a white wax or white soft paraffin base together with such stabilizers and preservatives as may be required.

It is to be appreciated that reference to treatment includes prophylaxis as well as the alleviation of established symptoms of the disease.

The reaction was allowed to stir for 2 hours. The reaction was cooled again to 5°C and a solution of 2-bromomethyl-1,3-dioxolane (782g) in tetrahydrofuran (780 ml) added, dropwise, over fifty minutes. Tetra-n-butylammonium iodide (75g) was added, portionwise, and the mixture was allowed to warm to room temperature, and was stirred for 14 hours. The reaction was then cooled to 5°C and a solution of lithium hexamethyldisilylazide in tetrahydrofuran (1.0M, 4.69l) was added dropwise. The mixture was stirred for 5 hours at room temperature. The solution was cooled to 5°C and a solution of ethyl-3-bromopropanoate (840.5g) in tetrahydrofuran (840ml) was added, dropwise, over 50 minutes. The reaction was allowed to stir for 14 hours. The reaction mixture was cooled to 5°C and 1.5M aqueous sodium hydroxide solution (4.25l, containing 255g of sodium hydroxide) was added and the mixture was extracted with ethyl acetate (2 x 3l). The combined organics were washed with water (2x5l). The aqueous phases were combined and acidified to pH1 using 5N aqueous hydrochloric acid solution and then extracted with ethyl acetate (2 x 3l).

The combined organic extracts were concentrated under reduced pressure to a concentration of approximately 3ml/g based on the theoretical yield of the product.

Dichloromethane (50ml) was then added, and the solution was washed with water (100 ml). The organic phase was dried over anhydrous magnesium sulphate, filtered, and the solvent was removed under reduced pressure, to give the title compound (390 mg), which was used without further purification.

The thick slurry was then stirred with cooling in an ice-bath for 2 hours, filtered, the solid washed with ethyl acetate (2 x 1l) and then dried under reduced pressure at 35°C to give 1.85kg of material. A portion of this material (1.34kg) was dissolved in a mixture of butanone (2l) and water (503ml) that was heated under reflux. A further portion of butanone (4.7l) was added and the solution was allowed to cool slowly to room temperature overnight. The resulting solid was filtered off, washed with butanone (2 x 1l) and dried under reduced pressure at 35°C for 10 hours to give 563g of material (93.8% e.e.). A further recrystallisation from butanone/water gave the title compound as a (S)-(-)-alpha-methylbenzylamine salt in 99.8% e.e. To a stirred solution of this salt in ethyl acetate and water was added 5N aqueous hydrochloric solution until pH1 was achieved. 3(S)-1-Benzoyl-3-(3,4-dichlorophenyl)-3-(3-hydroxypropyl)piperidine

To 9-boracyclo[3.3.1]nonane (22.06 ml, 0.5M solution in tetrahydrofuran) was added a solution of the compound of *PREPARATION 52* (825 mg, 2.21 mmol) in tetrahydrofuran (15 ml). The mixture was stirred at room temperature for 90 minutes. Aqueous sodium hydroxide (3.7 ml, 3M solution) and ethanol (7 ml) were then added, and the mixture was cooled in an ice-water bath. Hydrogen peroxide (3.7 ml, 30% w/w aqueous solution) was then added dropwise and the solution was stirred for one hour.

Ethyl acetate (50 ml) was added, the solution was washed with water (2 x 50 ml) and the organic phase dried over anhydrous magnesium sulphate. The solution was filtered and the solvent removed under reduced pressure. The residue was dissolved in dichloromethane (20 ml) and the solution was cooled in an ice-bath. Triethylamine (1.5 ml, 5 mol. equiv.) and benzoyl chloride (0.65 ml, 2.5 mol. equiv.) were added, and the mixture was stirred for 40 minutes.

Dichloromethane (50 ml) was added and the mixture was washed with aqueous hydrochloric acid (2 x 50 ml, 2M solution). The organic phase was dried over anhydrous magnesium sulphate, filtered, and the solvent removed under reduced pressure.

The residue was stirred together with 4% sodium hydroxide in methanol solution (50 ml) for one hour. Dichloromethane (60 ml) was added, and the mixture was washed with water (100 ml). The organic phase was dried over anhydrous magnesium sulphate. The solution was filtered and the solvent was removed under reduced pressure to give a residue which was chromatographed on silica gel, eluting with a solvent gradient of hexane:ethyl acetate (4:1 to 1:3, by volume) to give the title compound (320 mg).

LRMS $m/z = 392$ ($m+1$)⁺.

TLC R_f - 0.22 (silica, hexane: ethyl acetate, 2:3 by volume).

INTERNATIONAL SEARCH REPORT

International application No.

PCT/EP 96/05613

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.: 16-17
because they relate to subject matter not required to be searched by this Authority, namely:
Remark: Although claim(s) 16-17
is(are) directed to a method of treatment of the human/animal
body, the search has been carried out and based on the alleged
effects of the compound/composition.
2. ☒ Claims Nos.: 18
because they relate to parts of the International Application that do not comply with the prescribed requirements to such
an extent that no meaningful International Search can be carried out, specifically:
See annex.
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all
searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment
of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report
covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is
restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
☐ No protest accompanied the payment of additional search fees.

FURTHER INFORMATION CONTINUED FROM PCT/ISA/210

A complete search of claim 18 which comprises substructures a) -k) is precluded for practical and economic reasons. Only 3-azetidiny1-1 subst. piperidines have been searched.
